

SOLUTIONS

SCANNING AND COLOR CORRECTION

■ Low Resolution Placement Files (APR/OPI)

We have the technology to provide you with a low-resolution 72-dpi placement file for page layout production. When the job is received for final imaging, the low-resolution image automatically swaps with its high-resolution counterpart on our servers. This allows you to increase your productivity by keeping your file sizes smaller.

■ ICC Color Management Solutions

Our color department operates in a controlled ICC Color Managed environment. As one of the early adapters of this technology, we have extensive experience in creating and attaching color profiles to your scans. With our ICC Color profiles, you can re-purpose your images across multiple printing processes and cross-media applications without loss of quality or need for re-scanning.
