

With technology specifically designed for high resolution film-based scanning, we provide superior Copydot scanning solutions through digitize printing film, dot-for-dot, and integrated all-digital computer-to-plate workflow.

SERVICES

- Copydot
- Descreening
- Perfection Cleaning
- File Retouching & Manipulation

FEATURES, ADVANTAGES AND BENEFITS

■ Inventory Management

Our technology allows you to reduce the amount of space, costs and risks associated with archiving traditional film. The original film can be discarded once it is digitized, copies are made and digital media archiving is complete.

■ Re-Creation of Original or Lost Artwork

We can reverse the reproduction process using descreening technology that removes film-based dots and creates a Tiff-based PhotoShop image file ready for color correction or image manipulation.

■ Electronic Film Stripping

Our Perfection software and workstation allow us to perform electronic stripping functions to any Copydot file even when you need to make changes to pre-digital era pieces or do not have the original file

■ Low Resolution Placement Files (APR/OPI)

High resolution Copydot files are extremely large and can dramatically slow desktop production if you place them in a page layout program. To solve this problem, we provide you with a low-resolution placement file for your page layout production. When the job is received for final imaging, the low-resolution file is automatically swap with its high-resolution counterpart stored on our servers. This allows you to increase your productivity by keeping your file sizes smaller.
